

Description: hi

after gmediafinder i develop a new software called ht5streamer, a new streaming apps written in javascript/html5/css and the new toolkit node-webkit ! the app support youtube and dailymotion engines for the moment

features are:

- search and view videos or playlists
- download videos
- convert audio from videos to mp3
- seek in videos
- fullscreen (with button in the player or the f touch and escape to exit or f too)
- browse suggested videos
- category search/browsing
- best rated/most popular browsing
- playlists search
- local playlist with database

everything without flash plugin and only html5 player (mediaelement)

and more :)

TO install it:

i don t have .deb or ppa ready (not possible for the moment) but the software include an update system :p

for the moment just download the zip file for your distrib, extract it then double click the "ht5streamer" file or run ./ht5streamer in your shell...

on linux only!

dependencies for this software are just ffmpeg, so run (for ubuntu/deb)

```
sudo apt-get install ffmpeg
```

(or use your package-manager for others distros...)

if it does not start on 64 bits and have a libudev.so.0 error, try:

```
sudo apt-get install libudev1
```

```
cd /lib/x86_64-linux-gnu/
```

```
sudo ln -s libudev.so.1 libudev.so.0
```

sources are on github or the .nw files:

<https://github.com/smolleyes/ht5streamer>

and

<http://sd-20470.dedibox.fr/ht5streamer/ht5streamer-32.nw>

or

<http://sd-20470.dedibox.fr/ht5streamer/ht5streamer-64.nw>

for the 64 bits...

node-webkit sources and binaries are here :

<https://github.com/rogerwang/node-webkit>

(the app use version 0.5.1)

you can translate the software in your language ! for that download the .nw extract in and look in the translations folder, create a dir for your language then edit the .json file you ll understand it s very easy then send me your dir by mail :)

currently i have english and french language...

please report errors if needed and donate if you like and use the software ! :D

enjoy ++

Changelog: v0.4.7 ----- * osx version done (10.7+) * play files from disk if already
downloaded * fix vevo videos (only
480p...) * added category
navigation for youtube/dailymotion
